

Dear Harshavarthan,

I would like to place on record my appreciation for the work you have undertaken for the Kumaraguru Global Engagement Office (K-GEO) in developing the Higher Studies and Global Masters platform.

The project began with a practical need - K-GEO was managing the International Masters journey of students through a combination of spreadsheets, documents, emails and manual follow-ups. The information was available, but it was dispersed across different places. What we needed was a system that could bring the journey together and make it easier for students, counsellors and the office.

You understood this requirement well and took ownership of translating it into a working platform. You led a team of student developers, coordinated the work, divided responsibilities and brought together different technical contributions to build the platform. You worked through problems with them, and kept everyone focused on turning the idea into a platform that K-GEO could genuinely use.

The platform brings the different stages of the student's journey into one system, from profile and consultation to AI-supported recommendations, readiness assessment, applications, progress tracking and parent reporting. The Student Portal allows students to maintain their profiles, book consultations and track their applications. The Counsellor Portal provides a 360-degree view of the student, including eligibility, Global Readiness, applications and the ability to review AI-generated university, programme and country recommendations.

What I particularly appreciate is the way you have combined technology with human guidance. The AI recommendations become a starting point for professional discussion and validation. This is an important distinction for a platform dealing with decisions as significant as higher education and international study.

The project also required you to understand how K-GEO actually works. You had to look beyond the technical requirements and understand the different users, their needs and the movement of information between them. That understanding is reflected in the way the platform connects the complete workflow. For K-GEO, the platform will reduce manual follow-up, improve visibility of student progress, standardise assessments and reports, and provide students with a more structured higher-studies experience.

I appreciate the initiative, ownership and technical effort you have brought to this project, creating a solution that genuinely helps K-GEO. What stood out to me was your willingness to take on problems as they came up, work through them patiently, and lead your team towards project completion.

Thank you to you and your team for contributing your skills, time and effort to a project that directly benefits larger student community. I am pleased to acknowledge your contribution and wish you continued success in your academic and professional journey.

With appreciation

Dr. Vijila Edwin Kennedy  
Director, Global Engagement Office (K-GEO)
